ABSTRACT

In spite of recognized significant contribution of SMEs to nations’ economy, Nigerian SMEs performance is below expectation. This is because SMEs in Nigeria today faces severe limitations in financing, management skill, marketing, modern technology and technical expertise. The objective of this study is to investigate the mediating role of access to finance on the positive relationship between entrepreneurial orientation (EO), market orientation (MO), learning orientation (LO), technology orientation (TO) and SMEs performance in Nigeria. A sample size of 522 SMEs operating in Kano, Kaduna and Sokoto states of Nigeria were selected using stratified simple random sampling techniques. Partial Least Squares-Structural Equation Modelling was used to analyze the data. Hence, the data analysis was conducted using SmartPLS 3.0. The results of path analysis indicate that access to finance mediates the positive relationship between MO, LO, TO and the performance of small and medium enterprises in Nigeria. This is an important additional explanation for the existence of the relationship between these strategic orientations and firm performance. The results further suggest that SMEs need to use their strategic activities to improve their ability to obtain finances in order to perform well. Finally, recommendations for further research are also discussed.

Keywords: SMEs; Strategic Orientation; Nigeria; Access to Finance; Firm Performance.

1. INTRODUCTION

Over the years, Small and Medium Enterprises (SMEs) have gained increasing attention all over the world. This is because they play a significant role in improving economic growth and development, ranging from poverty reduction to employment creation (Small and Medium Enterprises Development Agency of Nigeria [SMEDAN], 2012). In Nigeria, the contribution of SMEs to GDP and employment stands at 46.54% and 25%,
Mediating Role of Access to Finance on the Relationship between Strategic Orientation Attributes and SMEs Performance in Nigeria

respectively (Ndumanya, 2013; SMEDAN, 2012). However, the contribution is below expectation and remains a significant issue, more especially as the country aims to be among the big economies by 2020. Certainly, performing SMEs will play an important role in achieving this objective. Therefore, it is important to examine the factors that may improve performance of SMEs in Nigeria.

According to Barney (1991) strategic orientations are organizational cultures representing intangible resources for the firms. Similarly, Gatignon and Xuereb (1997) conceptualize strategic orientations as the strategic activities carried out by the firm to develop and improve firm activities for superior performance. Therefore, the interplay between different strategic orientations may provide firms with competitive advantages which can lead to better performance (Hult, Ketchen, & Slater, 2005). A number of studies have shown that EO, MO, LO and TO are the most important firm resources that can give firms a competitive advantage and lead to better performance (Mu & Di Benedetto, 2011; Salavou, 2010).

For instance, exponents of EO suggest that firms promoting entrepreneurial activities are better able to make their operations fit in a dynamic business environment which will have a positive effect on firm performance (Mu & Di Benedetto, 2011; Rauch, Wiklund, Lumpkin, & Frese, 2009). Literature on marketing suggests that the concept of MO is of great importance in affecting the culture of the organization and creating a behavior that will provide the firm with a sustained competitive advantage (Grawe, Chen, & Daugherty, 2009). Furthermore, it has been argued that due to the dynamic nature of the business environment, ability to learn more quickly than competitors may be the only source of sustainable competitive advantage. This indicates the importance of LO in developing new knowledge and transferring information into knowledge (Eris & Ozmen, 2012). The importance of technology and innovation in business cannot be over-emphasized, firms that are technologically oriented will have long-term success as they create and utilize new technological solutions, products and services (Hakala & Kohtamaki, 2011). Therefore, it has been argued that EO, MO, LO and TO could be an important measures of the way the SMEs are organized and its performance could be enhanced through acquiring external financial resources (Aminu & Shariff, 2014).

However, despite the notable importance of strategic orientations, prior studies have only investigated the effect of a single (Mahmoud, 2011; Su, Xie, & Li, 2011); or a combination of few strategic orientations (Mahmoud & Yusif, 2012; Wang, Chen, & Chen, 2012). Others investigated the direct relationship between EO, MO, LO, TO and SMEs access to finance (Aminu & Shariff, 2015). There is limited empirical evidence investigating whether access to finance by SMEs can mediate the relationship between these strategic orientation and the performance of SMEs as proposed by Aminu and Shariff (2014).
The remainder of the paper is structured as follows: Firstly, previous literature on EO, MO, LO, TO and firm performances were reviewed. The conceptual model in Figure 1 and the set of the study hypotheses were also presented. Then, there follows the methodology used in this research work and data analysis. The paper ends with a discussion of the implications, the limitations, and future research.

2. LITERATURE REVIEW

2.1. SMEs Performance

In several small business literatures, SMEs’ performance has been studied by a number of researchers. Most of these researches have focused on investigating SMEs’ performance determinants, in which several variables have been identified. According to Neely, Gregory and Platts (1995), firm performance is a concept that is often discussed in various studies, but rarely has a single definition. They argue that firm performance is the process of quantifying actions of a business firm that leads it to achieve its goals and objectives. From a business perspective, firms achieve their objectives if they perform in satisfying their stakeholders and customers’ needs more than their competitors. It also indicates how well the management manages the firm’s resources (Moullin, 2007).

However, Sandberg (2003) argues that the performance of SMEs is the ability to survive, grow and contribute to the creation of employment and alleviate poverty.

Though, to look at SMEs’ performance, it is important to understand what constitute the SMEs in the context of Nigeria. This is because the definitions for SMEs vary from country to country based on the countries’ guidelines for defining SMEs (Bouri, Breij, Diop, Kempner, Klinger, & Stevenson, 2011). In Nigeria, SMEs are defined based on the number of employees and total assets value excluding land and building. However, if there is a clash on classification between employment and assets criteria, the employment-based definition should take priority (SMEDAN, 2012).

*Source: SMEDAN (2012).*

Therefore, this study adopts the definition above, because it is more recent and accommodates various business firms, especially with regards to turnover compared to previous definitions (SMEDAN, 2012).

Many studies on firm performance have used several firm resources to investigate factor influencing SMEs’ performance. For example, several studies used EO to investigate firm
performance (Fatoki, 2012; Mutlu & Aksoy, 2014). Likewise, several studies have used
MO to examine firm performance (Huhtala, Siivonen, Frösén, Jaakkola, & Tikkanen,
2014; Suliyanto & Rahab, 2012). Other studies have considered LO as a variable that
improves firm performance (Farrell, Oczkowski, & Kharabsheh, 2008; Hakala, 2013).
Finally, several studies have used TO to investigate firm performance (Hakala &
Kohtamaki, 2011; Hortinha, Lages, & Lages, 2011; Voss & Voss, 2000).

2.2. EO and Firm Performance

Research in the past has recognized the relevance of EO to the performance of the firm
(Zahra & Covin, 1995). The most widely used meaning of EO is focused around the work
of Miller (1983), advanced further by Covin and Slevin (1989) and numerous others, and
later enhanced by Lumpkin & Dess (1996). EO indicates whether business firms take
decisions that are risky, proactive and innovative in achieving its objectives (Covin &
Slevin, 1989). Similarly, EO can be seen as a particular process through which firms relate
to opportunities and activities that lead to new business opportunities (Lumpkin & Dess,
1996). These processes, actions and intentions include risk taking behavior, ability to act
autonomously and proactively, in innovative and aggressive ways towards competitors
(Lumpkin & Dess, 2001). According to Wiklund and Shepherd (2005), EO is a firm’s
strategic ability to capture specific aspects of decision-making, methods and business
practices. Thus, firms with sound EO can have the ability to discover and use new market
opportunities. Covin and Miller (2014) refer to risk taking as high financial leverage.
Whereas innovativeness is the ability of the firm to come up with new products and ideas,
the strength of this ability is usually measured by the actuality of these ideas as products
(Covin & Miller, 2014). Lastly, proactiveness is looking into the future based on
environmental demand, where firms look out for opportunities and develop new products
to gain the advantages of pioneering and leading the competitors (Hughes & Morgan,
2007).

EO as a strategic resources of a firm found to relate positively with firm performance
(Hakala & Kohtamaki, 2010). Equally, study by Long (2013) found a positive relationship
between EO and firm performance. Similar empirical findings show that the higher the
firm’s EO, the more the firm can achieve superior performance (Kraus, 2013; Roxas &
Chadee, 2013). An investigation on the relationship between EO and LO indicates that
EO has direct effects on both profitability and growth (Hakala, 2013). Likewise,
Brouthers, Nakos and Dimitratos (2014) findings indicate that SMEs have higher
international performance when they have greater EO. Furthermore, the relationship
between EO and business performance in Malaysia was found to be positively significant
(Aziz, Mahmood, Tajudin, & Abdullah, 2014). According to Laukkanen, Nagy, Hirvonen,
Reijonen, and Pasanen (2013), EO has a positive influence on SMEs’ growth both in
Hungary and Finland through brand and market performance. The effect of EO on firm
performance in Dubai was confirmed to be positively significant (Al-dhaafri & Al-swidi,
2014). In contrast, some studies found no significant direct relationship between EO and
firm performance (Baker & Sinkula, 2009; Stam & Elfring, 2008). In the same view, the
notion of a direct relationship between EO and firm performance seems to be empirically
inconclusive. This can be seen in a study by Alegre and Chiva (2009) that found the direct
influence of EO over firm performance is not significant. A replication study by Frank et
al. (2010) found that EO does not have a substantial effect on firm performance, the study
showed a possible adverse effect of EO on performance.

2.3. MO and Firm Performance

There are different perspectives to MO, although all the perspectives put the customer at
a center stage. The perspectives also recognize the importance of information, functional
coordination, responding to customer and protecting stakeholders’ interest (Lafferty &
Hult, 2001). These MO perspectives include the decision making perspective (Shapiro,
1988), market intelligence behavior perspective (Kohli & Jaworski, 1990), culture of the
firm (Narver & Slater, 1990), information perspective (Ruekert, 1992) customer-
orientation perspective (Deshpandé, Farley, & Webster, 1993). However, there are some
essential differences among these perspectives and numerous similarities that reflect what
MO is. Based on these perspectives, Lafferty and Hult (2001) synthesized and integrated
these perspective into cultural and managerial foci. Generally, MO as the implementation
of marketing concept, has gained considerable attention in the firm performance literature
(Dauda & Akingbade, 2010).

According to Kara, Spillan, & DeShields Jr. (2005) MO and small-sized firm performance
is positively significant. The study concludes that MO is a significant predictor of business
performance. Dauda and Akingbade (2010) indicate that small businesses that engage in
MO activities recorded a superior performance compared to others that have not applied
MO. Similarly, MO and performance relationship was found to be significant in a study
of 356 SMEs in Malaysia (Idar & Mahmood, 2011). Likewise, a study on SMEs in Ghana
indicates a significant impact of MO on firm performance (Mahmoud, 2011). In Vietnam
Long (2013) reports that MO has a significant positive effect on firm performance. In
country comparison study, Laukkanen et al. (2013) report that in Finland and Hungary,
MO influences firm growth through branding and market performance. Despite a notable
influence of MO on overall firm performance, some past studies have reported effect of
MO on only subjective performance (Farrell et al., 2008; Jaworski & Kohli, 1993). While
others reported positive relationship only on objective (Baker & Sinkula, 2009;
Nikoomaram & Ma’atoofi, 2011). To this end, Mahmoud and Yusif (2012) found a
significant positive effect of MO on both economic and non-economic performance.
Subsequently, it can be concluded that the influence of MO on firm performance varies
depending on the performance measure adopted in the study. In addition, despite the
important of MO in predicting firm performance, some studies report no significant direct
effect of MO on firm performance (Polat & Mutlu, 2012; Suliyanto & Rahab, 2012).
2.4. **LO and Firm Performance**

Although the concept of LO can be found in several areas of research, including psychology, sociology and education, LO has become one of the principal strategic orientations in strategic management (Mavondo, Chimhanzi, & Stewart, 2005). Slater and Narver (1995) argue that due to the inability of MO to predict firm performance, business firms need to be learning oriented if they want to be successful in the long-run. Similar to this argument, Farrell (2000) states that there is a need for business firms to facilitate learning in their firms. This is because LO is a source of competitive advantage. However, Slater and Narver (1995) contend that market-oriented firms must develop LO culture in order to face competition effectively. According to Baker and Sinkula (1999), LO is a set of organizational behavior that affects how business firms learn from their business environment and respond to the needs of the environment. In the same vein, LO is a firm valuable resource that influences the tendency of the firm to create and use knowledge (Farrell & Mavondo, 2004).

A study of 449 entrepreneurs reports that firm performance is positively affected by LO culture of the firm (Kropp, Lindsay, & Shoham, 2006). In trying to find a clear picture of whether businesses should focus more on LO or MO, Farrell et al. (2008) found LO significantly influences performance of international joint ventures although MO has more significant influence. In addition, Jiménez-Jiménez and Sanz-Valle (2011) investigate organizational learning process and its effect on innovativeness and performance. The study found that organizational learning has a positive influence on business performance. Mahmoud and Yusif (2012) report a positive significant relationship between LO and both economic and non-economic performance. Comparative study of SMEs in Hungary and Finland shows that the relationships between LO and firm performance vary across countries. The results suggest that while the direct relationship between LO and brand performance is positive among Hungarian SMEs, the relationship is negative among Finnish SMEs (Laukkanen et al., 2013). Similarly, Hakala (2013) examines the mediating role of LO and the study reports that LO has a direct effect on performance, more specifically firm growth and profitability and effect of EO on profitability is mediated by LO behaviors. A contrary result was reported by Jiménez-Jimenez et al. (2008) found that organizational learning has no significant direct effect on performance. Also, Suliyanto and Rahab (2012) indicate that there is no positive effect of LO on firm performance. Similarly, Long (2013) studies the impact of strategic orientations on firm performance, the study found no significant relationship between LO and firm performance.

2.5. **TO and Firm Performance**

Another important element of strategic orientation is TO. Recently, TO has been focused on in several strategic orientation literature as one of the essential components that contributes to firm value delivery (Gatignon & Xuereb, 1997). Ettlie, Bridges and
O’keefe (1984) suggest that technology in a firm promotes creative effort of the firm. Achieving business goal lies on the ability of the firm to welcome new ideas and quick adaptation of new technologies (Hurley & Hult, 1998). Technological superiority determines the acceptability of the product in the market because consumers prefer quality goods and services. Thus, firms that are committed to research and development, and that employ new technologies will undoubtedly achieve competitive advantage (Voss & Voss, 2000). Therefore, TO is a firm’s ability and willingness to develop technological mindset and utilize it in improving or developing products and services (Gatignon & Xuereb, 1997).

Gatignon and Xuereb (1997) report a significant positive relationship between TO and innovation superiority and firm performance. Likewise, Gao, Zhou, and Yim (2007) reveal that TO positively affect firm profitability and product performance with average technological changes, while it has no significant effect on sales growth. However, the study indicates that with little technological turbulence, TO has a negative effect on business performance. Another result found that TO has significant positive influence on product performance, particularly in terms of newness of the product to customers (Salavou, 2010). Additionally, Mu and Di Benedetto (2011) found that TO has a significant effect on product commercialization performance. Similarly, Spanjol et al. (2011) report similar findings on the significant positive effect of TO on a firm’s product innovation performance. According to Hoq (2009) and Paladino (2007), TO relates significantly to overall firm performance. In contrast, Voss and Voss (2000) found no significant effect of TO on both subjective and objective performance of a firm. In a study that examined the interplay between EO, TO and customer orientation, the results show that TO has no direct significant relationship with performance (Hakala & Kohtamaki, 2010). Also Hortinha et al. (2011) report that TO does not affect performance directly.

2.6. Access to Finance

Financial capital is the most common type of resource that is relatively easy to convert into other types of resources. Hence, access to capital is important for small businesses’ performance (Wiklund & Shepherd, 2005). Access to finance is one of the critical issues responsible for gross low performance of SMEs in Nigeria. Therefore, having financial resources can enhance their performance (SMEDAN, 2012). Several studies have shown that a firm’s superior performance is attributed to the ability of the firm to access required financial capital (Demir & Caglayan, 2012; Turyahebwa, Sunday, & Ssekajugo, 2013). However, access to finance is evidently depends on the firm’s strategies (Cheng, Ioannou, & Serafeim, 2014). It is apparent that firms with high entrepreneurial skills will have better access to resources, including financial resources (Mohammed & Obeleagu-nzelibe, 2014). Similarly, firms that are market-oriented have been found to have positive influence on the firm’s profitability (Baker & Sinkula, 2009). In short, it is expected that market-oriented firms can generate high income, specifically with learning from the environment. Technological superiority is no doubt a good firm strategy that can improve
ability to have more funds, since such firms can produce superior products that can compete favorably in the market and perform better (Aminu & Shariff, 2015).

Based on this premise, it is expected that access to finance can be a mechanism through which EO, MO, LO, and TO positively relate to SMEs’ performance. This is one of the important empirical contributions of this study because it offers a more nuanced explanation on how these strategic orientations affect firm performance. Although numerous studies (Baker & Sinkula, 2009; Long, 2013) have explained that EO, MO, LO and TO influence firm performance. However, a lack of empirical evidence on the mechanisms, such as access to finance through which firm performance is affected. Hence, access to finance may provide the necessary explanation of how EO, MO, LO and TO enhance firm performance. In other words, this study posits that:

\[ H1: \text{Access to finance mediates the positive relationship between EO and performance of SMEs in Nigeria.} \]
\[ H2: \text{Access to finance mediates the positive relationship between MO and performance of SMEs in Nigeria.} \]
\[ H3: \text{Access to finance mediates the positive relationship between LO and performance of SMEs in Nigeria.} \]
\[ H4: \text{Access to finance mediates the positive relationship between TO and performance of SMEs in Nigeria.} \]

3. METHODOLOGY

Based on literature, strategic orientations are normally operationalized from the firm level perspective (Covin & Slevin, 1989; Hortinha et al., 2011). In SMEs studies, the target respondents are usually the owner-managers, given that they have more knowledge regarding their enterprises’ strategies and overall business situations (Zahra & Covin, 1995). Therefore, the unit analysis of this study is firm level and the target respondents are SME owner-manager in Kano, Kaduna and Sokoto states of north-western Nigeria. This is in line with several studies on SMEs’ performance (Hakala & Kohtamaki, 2011; Nikoomaram & Ma’atoofi, 2011).

This study follows a quantitative methodology, where numbers are used to represent the phenomenon being studied (Hair Jr., Black, Babin, & Anderson, 2010). The study adopts a survey research design and is cross-sectional as data was collected at one time. The research model consists of six reflective constructs EO, MO, LO, TO, access to finance and firm performance. The study adapted measurements based on the previous studies relevant to the current research context (Churchill, 1979). The present study measures items on a seven-point Likert-scale (1 = Strongly disagree; 2 = Disagree; 3 = Somewhat disagree; 4 = Neither agree or disagree (Neutral); 5 = Somewhat agree; 6 = Agree; 7 = Strongly agree). The items were adapted from previous studies, firm performance from...

The population in this study are the SMEs operating in the Kano, Kaduna and Sokoto states of north-western Nigeria. North-western Nigeria has the highest number of SMEs in the country, out of which 5,010 are small and medium (SMEDAN, 2012). The sample size for this study is 348 SMEs. This is obtained from the sampling formula by (Dillman, 2007). The sample was increased to 522 to avoid non-response problem and sample size error (Salkind, 1997). Samples were disproportionately selected randomly from each stratum of Kano, Kaduna and Sokoto based on the respective sample size (Sekaran & Bougie, 2010). Using the list of SMEs (sampling frame) that were provided by SMEDAN, 522 copies of the questionnaire were administered on the randomly selected target respondents (SMEs owner-managers). Samples for each stratum were selected using a random number generated function in MS Excel 2010 (RAND) in line with (Saunders, Lewis, & Thornhill, 2009).

The study used Partial Least Square Model to analyse the data. SmartPLS v3.0 (Ringle, Wande, & Becker, 2014) was used to determine the outer model (reliability, convergent validity and discriminant validity) and inner model (significance of the path coefficients, coefficient determination, the effect size and predictive relevance).

4. DATA ANALYSIS AND RESULTS

4.1. Common Method Bias Test

There are several procedures and statistical techniques to treat common method variance. These include wording questions in reverse, clarity of questions or items, confidentiality of the respondents and statistical Harman’s one-factor test (Podsakoff, MacKenzie, Lee, & Podsakoff, 2003). In this study, un-rotated factor analysis with seventy items of all the variables of the study revealed that no single factor accounted for more than 50% of the variance. The result produced 16 distinct factors and only 21.61% of the total variance was accounted by a single factor, indicating the absence of common method bias in this study. This is in line with Podsakoff et al. (2003) and Lowry and Gaskin (2014), who argue that common method bias is present when a single factor explains more than 50% of the variance.

4.2. Evaluation of PLS-SEM Result

After the checking and screening of the data, the next step was to assess the outer model and inner model (Hair Jr., Hult, Ringle, & Sarstedt, 2013). PLS-SEM was used in this study to evaluate the outer model (measurement model) and the inner model (structural
model). In other words, PLS-SEM was used to analyze the mediating results of this study. SmartPLS 3.0 by Ringle et al. (2014) was used to determine causal links among the constructs in these theoretical models.

4.2.1. The Measurement Model

Reliability and validity are the two main criteria used in PLS-SEM analysis to evaluate the outer model (Hair Jr. et al., 2013). The conclusion about the nature of the relationship among constructs (inner model) depends on the reliability and validity of the measures. The suitability of the outer model can be assessed by looking at: (1) individual item reliabilities, i.e., indicator reliability and internal consistency reliability using composite reliability (CR); (2) convergent validity of the measures associated with individual constructs using average variance extracted (AVE); and (3) discriminant validity using Fornell-Larcker criterion and the indicator’s outer loadings.

</table>
In this study, internal consistency reliability was assessed by examining CR. Therefore, in this study, composite reliability and Cronbach’s alpha values for all the constructs were examined, and the results in Table 4.1 show that all CR and Cronbach’s alpha values exceed the recommended threshold value of 0.70 (Hair Jr. et al., 2013; Henseler, Ringle, & Sinkovics, 2009). The CR values in this study ranges between 0.84 to 0.94, indicating the reliability of the measurement model.
With regards to identifying an element of convergence in the measurements of the construct, AVE was used with a threshold value of 0.50 and above (Henseler et al., 2009). Therefore, results in Table 4.1 show that the AVE value of all the constructs exceed the threshold value of 0.50. The result reveals AVE values range from 0.54 to 0.66; so it can be concluded that convergent validity is established.

Then, discriminant validity was considered, which concerns the extent to which one construct is actually different from another construct (Hair Jr. et al., 2013). The most conventional approach in assessing discriminant validity is Fornell-Larcker Criterion (Hair Jr. et al., 2013). Therefore, in this study, discriminant validity was assessed by comparing the square root of the AVE for each construct with the correlations presented in the correlation matrix. Table 4.2 shows the results of Fornell-Larcker Criterion assessment with the square root of the constructs. The AVE in bold is greater than its highest construct’s correlation with any other constructs. Thus, it is concluded that discriminant validity on the construct has been established (Hair Jr. et al., 2013; Henseler et al., 2009).

Lastly, in this study, outer factor loading as important criteria in assessing indicator’s contribution to assigned construct was examined. Outer loadings were examined based on the threshold value of 0.50 and above (Hair Jr. et al., 2010). However, Hair Jr. et al. (2013) stressed that outer loading greater than 0.40 but less than 0.70 should be carefully analyzed and should be deleted only if it increases the value of CR and AVE. Table 4.3 indicates that all the bold values of the loading exceed the suggested threshold of 0.50 and above, showing satisfactory contribution of the indicators to assigned constructs. Additionally, as argued by Hair Jr. et al., (2013), discriminant validity can be assessed by examining the indictors’ outer loadings. They argue that discriminant validity can be established when the indicator’s outer loading on a construct is higher than all its cross-loading with other constructs. Hence, Table 4.3 indicates absence of discriminant validity problem since the loadings are greater than 0.5, and no any other indicator has loading more than the one it intends to measure.

4.2.2. The Structural Model

As mentioned earlier, once the measurement model (outer model) was examined and the reliability and validity of the model established, the next step was to evaluate the outer model (structural model) results. This involved assessing the outer model’s predictive abilities and the relationships between the constructs. As suggested by Hair Jr. et al. (2013), before assessing the structural model, collinearity should be examined. The results show that there is no collinearity among the predictor constructs in the structural model as the VIF values are clearly below the threshold of 5.

According to Hair Jr. et al. (2013), the key criteria for assessing the structural model in PLS-SEM are the significance of the path coefficients, coefficient determination (R²), the effect size (f²) and predictive relevance (Q²). Mediation analysis assesses the indirect effect of the independent variable on the dependent variable via an intervening variable. However, Preacher and Hayes (2008) observe that the techniques for assessing mediation are numerous, however, the most recent mediation analysis approach is the bootstrapping method. Where the bootstrapping generates an empirical representation of the distribution of the sample of the indirect effect (Rucker, Preacher, Tormala, & Petty, 2011).

The justification and advantages of bootstrapping method to test mediation have been highlighted by several studies, such as (Hair Jr. et al., 2013; Hayes & Preacher, 2010). Hayes and Preacher (2010) and Preacher and Hayes (2008) conclude that the main advantage of bootstrapping approach is that it does not require any assumptions about the sampling distributions of the indirect effect or its product. Knowing the advantage of bootstrapping method over other methods, Hair Jr. et al., (2013) and Hayes and Preacher (2010) suggest testing the significance of the mediation using bootstrapping methods. Hence, this study tested the mediating role of access to finance on the influence of EO, MO, LO, and TO on firm performance with SmartPLS 3.0 with 362 cases and 5,000 sub-samples. It is therefore clear from Table 4.5 that access to finance mediates the relationship between MO and firm performance (β,.03; t=1.67; p<.05); LO and firm performance (β.02; t=1.75; p<.05); and TO and firm performance (β.05; t=2.19; p<.01). However, Table 4.4 shows that access to finance does not mediate the relationship between EO and firm performance (β.-02; t=-1.36; p<.1).

Notes: *: p<0.1; **: p<0.05; ***: p<0.01.
According to Cohen (1988), $R^2$ values of .27, .13 and .02 indicate substantial, moderate and weak, respectively. Results in Figure 4.1 show that the $R^2$ value of access to finance (.21) is moderate and firm performance (.27) is slightly substantial. This $R^2$ value is higher than the one reported by Hakala (2013) and Mahmoud and Yusif (2012), respectively.

It follows that the $R^2$ value indicates all the four exogenous variables (EO, MO, LO, and TO) combined together in the model explain 21% variance in the mediating variable access to finance. Similarly, the holistic $R^2$ value indicates that all the six exogenous variables (EO, MO, LO, TO, access to finance and business environment) combined together in the model explain 27% variance in the endogenous variable (firm performance). Consequently, based on the assessment of the $R^2$ of the endogenous latent variables firm performance (.27) and access to finance (.21), it is concluded that the model has substantial predictive validity.

Having assessed the coefficient of determination of the endogenous constructs (access to finance and firm performance), the next criterion assesses the effect size ($f^2$) as suggested by Hair Jr. et al. (2013). The threshold of 0.02, 0.15, and 0.35 have been proposed as small, moderate and large effects, respectively (Cohen, 1988). However, Chin, Marcolin and Newsted (2003), stress that even the tiniest strength of $f^2$ should be considered as it can influence the endogenous variables. In this study, the effect size for the exogenous construct found to be statistically significant to affect the endogenous variables are assessed and reported. The result in Table 4.5 shows the effect size of the particular exogenous construct on the respective endogenous construct. The result indicates that
most of the exogenous constructs have small effect size on their respective endogenous construct.

Finally the predictive relevance $Q^2$ assessment which can be carried out using Stone-Geisser’s $Q^2$ test and measured using blindfolding procedures (Hair Jr. et al., 2013; Henseler et al., 2009). Therefore, this study used Stone-Geisser test to assess the $Q^2$, through blindfolding procedure to obtain the cross-validated redundancy measure for endogenous latent construct (Hair Jr. et al., 2013). Table 4.6 presents the cross-validated redundancy for access to finance and firm performance. The result shows that all the $Q^2$ values are greater than zero access to finance (.10) and firm performance (.16); this suggests a substantial predictive relevance of the model. This is in line with the suggestion by Hair Jr. et al. (2013) and Henseler et al. (2009) that $Q^2$ values greater than zero indicate the model has predictive relevance, while $Q^2$ values less than zero, indicate the model lacks predictive relevance.

5. DISCUSSION

The objective for this study is to examine the mediating role of access to finance on the positive relationship between EO, MO, LO, TO and performance of SMEs in Nigeria. So, four mediating hypotheses were proposed and tested using bootstrapping method (Preacher & Hayes, 2008). Precisely, hypotheses H1, H2, H3 and H4 were tested to see the mediating role of access to finance.

In order to attain this essential objective, H1 was tested which states that access to finance mediates the positive relationship between EO and performance of SMEs in Nigeria. The
statistical result indicates that access to finance does not mediate the relationship between EO and firm performance. This result, however, is not surprising given the fact that the path from EO to access to finance was inversely significant in the direct relationship. Hence, H1 is not supported. A plausible reason for this is that the more SMEs perceive high environmental risk, the less they engage in profitable business. In other words, high EO means high risk that requires significant amount of financial resources rather than generating the resources. Therefore, the role of financial resources in explaining the relationship may not be noteworthy.

Secondly, H2 states that access to finance mediates the positive relationship between MO and performance of SMEs in Nigeria. However, in this study, MO did not significantly affect firm performance directly, but it has a direct and positive impact on the access to finance. Interestingly, the result shows that MO affects firm performance through access to finance. In other words, the relationship has good magnitude and is significant due to the mediation role of access to finance. In summary, based on the present study’s results, the influence of MO on firm performance is better understood through the mediational role of access to finance. Hence, H2 is supported. In this case, the result demonstrates that SMEs’ ability to attract, retain more customers and deal with competition, lead to improvements in their financial resource access, and consequently to achieving higher performance. This seems to indicate that firm performance depends on MO when firms have access to finance. The finding concurs with the past research (Huhtala et al., 2014; Mahmoud & Yusif, 2012) which shows that MO is related to firm performance through some mediating variables.

Thirdly, H3 is supported as the result establishes that access to finance mediates the relationship between LO and firm performance. According to this finding, implementing LO will help SMEs to increase their financial accessibility and in turn improve firm performance. This result also shows that no matter how much a firm is learning oriented, or good in using information, it cannot assure firm performance if it cannot get access to enough financial capital. Moreover, this explains that although a large number of SMEs are looking for better performance, few of them perform sufficiently. This is because they refuse to acknowledge that their strategies are essential to getting financing. Moreover, this finding shows that SMEs can use learning to increase their financial resources and improve performance.

Lastly, H4 is also supported as the result indicates that the mediatory role of access to finance between TO and firm performance relationship is quite significant. This sheds more light that TO facilitate SMEs’ ability to generate more financial resources that can lead to firm performance. To this end, the results of this study suggest that SMEs in Nigeria need to be technology oriented which will lead them to better access to finance and superior performance.
Conclusively, the study shows that the strategic orientations (MO, LO and TO) indirectly explain firm performance through access to finance. This is important additional explanation for the existence of the relationship between these strategic orientations and firm performance. The results further suggest that SMEs need to use their strategic activities to improve their ability to obtain finances in order to perform well. While strategic orientations appear as viable predictors of firm performance, the evidence suggests that SMEs, combining it with other orientations, have higher access to finance and perform much better. Consistent with the RBV, the findings suggest that strategic orientations are culture-based, valuable and sophisticated firm resources that can lead to competitive advantages.

The study is subject to the usual limitations with cross-sectional, quantitative research design, single informant (owner-manager) and regional bias. Future studies should use longitudinal study and combine both quantitative and qualitative methods. Additionally, future studies should collect data from multiple participants (owners, managers and financiers) separately per enterprise. Finally, this study examined the mediating role of access to finance on the relationship between EO, MO, LO, TO and performance of SMEs in Nigeria. The independent variables tested in the study were confined to SMEs’ performance. Other factors that belong to a firm’s strategic resources, such as employee orientation, cost orientation and network orientation can be used to extend the framework proposed in the study. Future researchers could further broaden the scope of this study by conducting a configurational approach (three-way interaction model) to explain the variance in performance.
